Terminal & File Navigation
GeoPython — Quick Reference Handout 01

Linah Ababneh, Ph.D.
LA Research & Consulting

1. CORE TERMINAL COMMANDS

Command	What it does
`cd FolderName`	Enter a folder (case-sensitive on Mac/Linux)
`cd ..`	Go back one folder level
`cd OneDrive\Documents\...`	Full path — required if folder is on OneDrive
`dir`	List files in current folder (Windows)
`ls`	List files in current folder (Mac/Linux)
`pwd`	Show your current location (full path)

! cd .. (with a space) moves you back one folder. Typing .. alone is not a command and will produce an error.

2 . THE ONEDRIVE VARIABLE

If your folder is synced to OneDrive, its address changes. The Command Prompt is literal — it uses the actual location on disk.

Without OneDrive	With OneDrive Active
`Documents\Geoscience-python`	`OneDrive\Documents\Geoscience-python`

Visual cue: look for green checkmarks or the OneDrive name in your File Explorer header. If you see them, you must include OneDrive\ in your path.

3. THE ADDRESS BAR SHORTCUT (BREADCRUMB TRICK)

Instead of typing long paths manually, let Windows do the work:

1	Open your folder in File Explorer.
2	Click into the blank space in the address bar at the top.
3	The breadcrumb path highlights in blue — press Ctrl + C to copy.
4	In Anaconda Prompt: type cd (space), then right-click to paste.
